2009 SOFTWARE UNIVERSE CONFERENCE -June 2009-

In June, **etech** descended on the **2009 Software Universe Conference** with state-of-the-art content recording services that brought HP's over 150 breakout sessions to a whole new level. The new technology, incorporated into 40 different breakout rooms, allowed session content to be recorded with multiple windows so that viewers can see the speaker and the presentation screen simultaneously; event hosts are then able to post session content for broader global viewing. The result? An arsenal of high quality archived content which can be easily accessed to allow a massive second-tier of conference participants to virtually engage in event proceedings when physical attendance is not possible.

In addition to high-end content recording services, **etech** also supported the **2009 Software Universe Conference** by providing:

- Significant pre-production project management, including detailed labor scheduling, CAD diagramming, and equipment/cabling specifications
- Full presentation management, including pre/onsite/post production and software application allowing for centralized review/approval of all pending presentation content
- High-speed internet throughout venue including Wi-Fi and over 500 concurrent users and 300 CAT5 wired Ethernet drops
- rental computers (imaged, installed, supported, and removed)
- high-servers (supplied and managed)
- 60 meeting rooms equipped with full audio visual capabilities
- 22 networked LCD digital signs with dynamic content
- Onsite project management
